Gloria Oblouk Darovic, RN, CCRN, Lecturer/Consultant, American Medical Education, Inc., San Diego, CA

Love this book! It takes the most important things from the big book. Has great illustrations.

My cardiovascular tech instructor recommended the book (the HUGE textbook version). I purchased the handbook and found all the information I need. The instructor did not know this Darovic handbook was available but was impressed with the features.

Just awesome!!

I am a critical care nurse going back to school for CRNA. This book was recommended to be by a CRNA. It is a great resource book that I keep in my work bag if I need a quick reference.

none

This book is terrible. The print is way too small. Not worth the money. There are other books with the same material that can be used.

This is an excellent source of information for the new and experienced critical care nurse. The book contains a wealth of extremely detailed information with regard to anatomy, physiology, pathophysiology, and hemodynamic monitoring. This book covers equipment set up, maintenance, and trouble-shooting. It is full very useful information, for example, how cardiac output and pulmonary wedge pressures are effected by other hemodynamic parameters or outside influences such as PEEP levels and how to account for the increased intrathoracic pressure. Lots of calculations to show you how doctors arrive at decisions and numbers. The book is set up from broad to specific with great organization. Highly recommended.

A great book that is small enough to keep close. As a nurse, it is a great resource!
