I've been watching A LOT of videos on resistant starch after reading the starch solution. I was kind of getting it but still trying to get the big picture. This helped tons. New term to figure out in detail, butyrate... simple and interesting. I already do the cook/cool of potatoes. I eat them for breakfast and lunch and I always feel full and satisfied. I'm now trying to eat only when hungry and not at standard meal times because the potatoes leave me full for so long. I used to get super snacks at work, not anymore. I'm often still not hungry at dinner time. I do not add oils to my potatoes. I put a white gravy made with cashew milk so calories remain low for added items.

Your body usually uses the glucose it needs from the carbohydrates almost immediately, storing the rest of the glucose in your liver and muscles as glycogen. Glycogen is a complex carbohydrate that your system converts to glucose when carbohydrates from food are unavailable. When your body needs energy to fuel cells, such as when you are doing a rigorous workout, the body will burn stored glycogen, turning it into energy, if you do not have enough carbohydrates readily available. This is why you might feel fatigued early in your workout, especially if you haven't eaten anything recently before the workout.
